A PROJECT REPORT

Submitted by

In the partial fulfillment of the award of the degree of

BACHLOR OF COMPUTER SCIENCE

UNDER THE GUIDANCE OF

Mrs. B SARANYA.,ME

Assistant Professor

DEPARTMENT OF COMPUTER SCIENCE
ST.THERESA'S ARTS AND SCIENCE COLLEGE FOR WOMEN,
THARANGAMBADI .
(Affiliated to Annamalai University)
MAR – 2026

1. Introduction

The Courier Management System is developed using the Salesforce platform to manage courier operations efficiently.
This system helps manage customer details, shipment information, delivery agents, and invoices in an organized way.

The system also provides reports and dashboards to analyze courier data and monitor overall performance.

2. Problem Statement

Courier companies handle many shipments daily. Managing customer details, shipments, and delivery agents manually can lead to errors and inefficiency.

Therefore, a digital system is required to automate courier management and track shipments effectively.

3. Objectives

The objectives of this project are:

- To manage customer information
- To track courier shipments
- To manage delivery agents and branches
- To generate invoices for shipments
- To analyze data using reports and dashboards

4. Phase Wise Documentation:

Phase 1: Planning Phase

In this phase, the project idea and requirements are identified. The need for a Courier Management System is analyzed and the project scope is defined.

Activities:

- Identifying project requirements
- Understanding courier operations
- Defining project objectives

Phase 2: Requirement Analysis Phase

In this phase, the system requirements are analyzed.

The system must support customer management, shipment tracking, delivery agent management, invoice generation, and reporting.

Functional Requirements :

- Add and manage customer records
- Track shipments
- Manage delivery agents
- Generate invoices
- Generate reports and dashboards.

Phase 3: System Design Phase

In this phase, the system design is planned.

The following Salesforce objects are designed for the system:

- Customers

- Branches
- Delivery Agents
- Shipments
- Invoices

Relationships between objects are defined to maintain proper data structure.

Phase 4: Development Phase

In this phase, the system is developed using Salesforce.

Custom objects and fields are created, and reports and dashboards are designed.

Development Activities:

- Creating custom objects
- Adding fields
- Creating reports
- Designing dashboards.

Phase 5: Testing Phase

In this phase, the system is tested to ensure that all functionalities work properly.

Different records are created and tested to verify the system.

Reports and dashboards are also checked to ensure accurate data representation.

Phase 6: Implementation Phase

In this phase, the system is implemented and ready for use.

Users can start using the system to manage courier operations such as adding customers, tracking shipments, and generating reports.

Phase 7: Maintenance Phase

In this phase, the system is monitored and maintained.

Any issues are fixed and updates can be applied when needed.

5. System Modules:

The Courier Management System consists of several modules that help manage different courier operations efficiently.

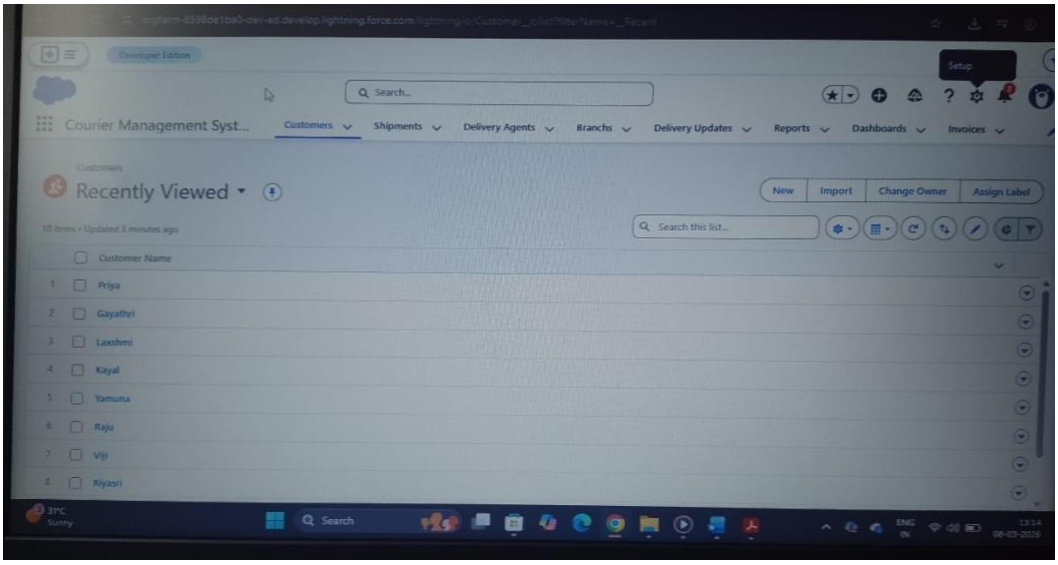
5.1 Customer Management Module

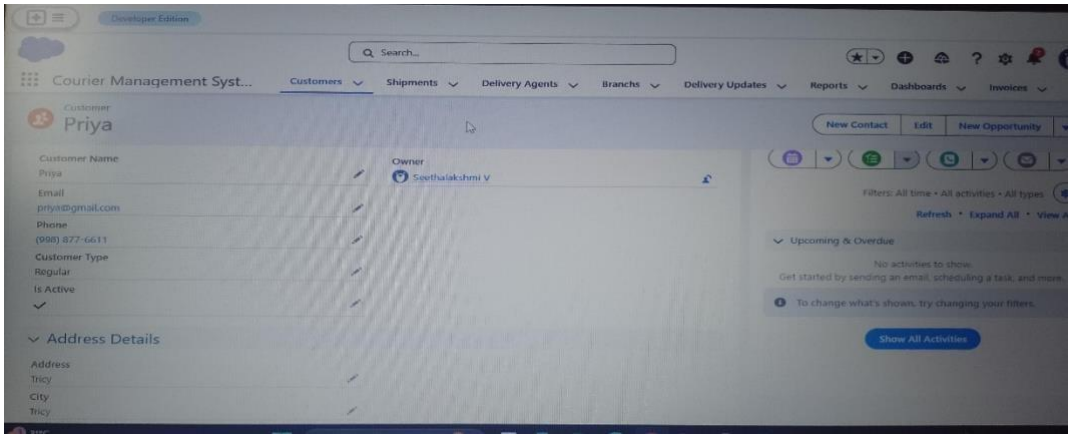
The Customer Management Module is used to store and manage customer information.

Functions:

- Stores customer details such as name, phone number, and address
- Allows users to add new customer records • Helps maintain customer information in the system
- Makes it easy to search and view customer details.

Screenshot:





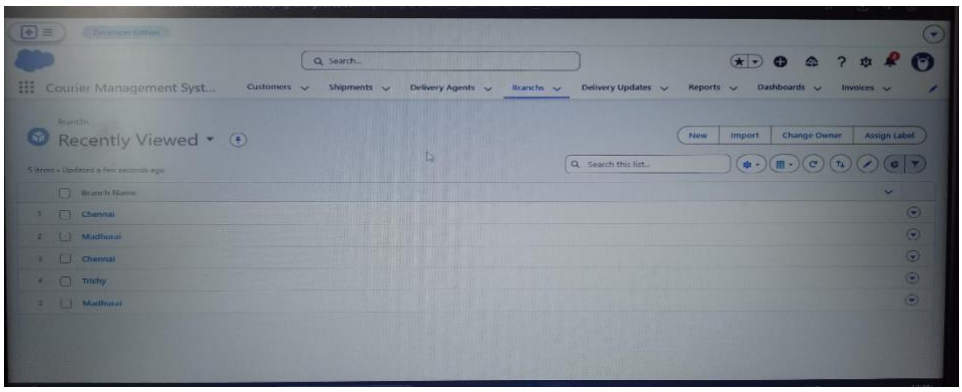
5.2 Branch Management Module

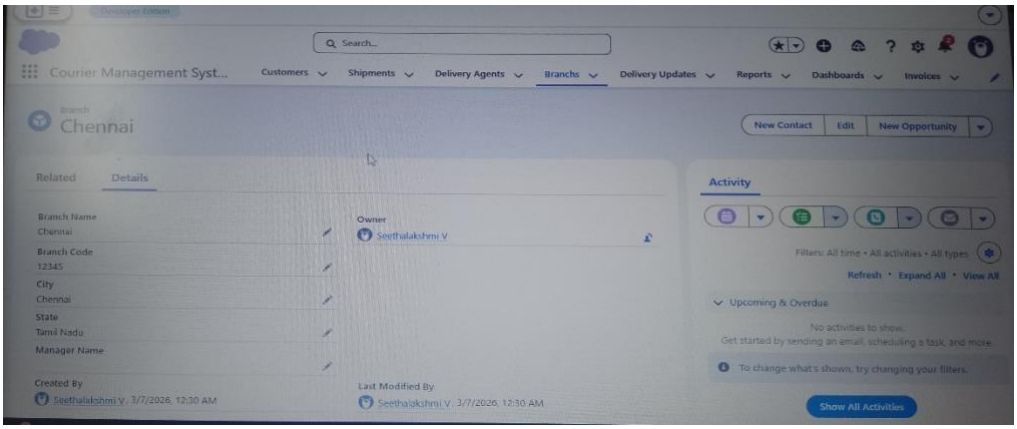
The Branch Management Module manages information about courier branches.

Functions:

- Stores branch details such as branch name and location
- Helps identify which branch handles the shipment
- Allows users to add and manage branch records
- Maintains branch information in the system.

Screenshot :





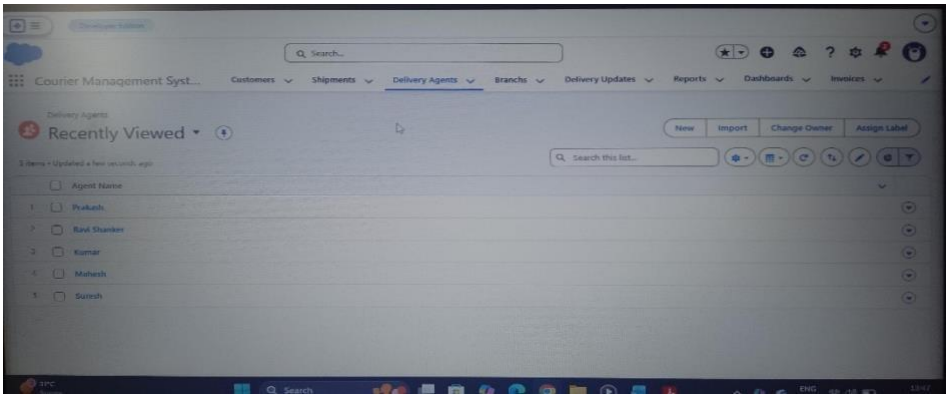
5.3 Delivery Agent Management Module

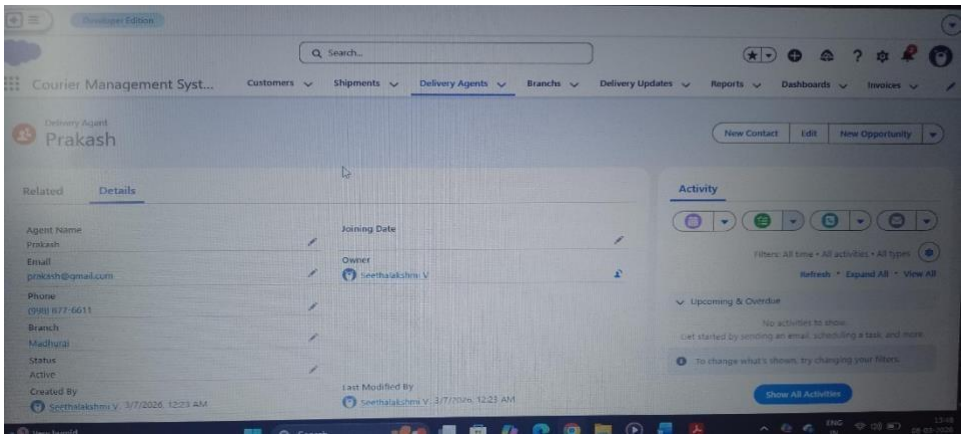
This module stores and manages delivery agent information.

Functions:

- Stores delivery agent details such as name and contact number
- Assign delivery agents to branches
- Helps track the agents responsible for delivering shipments
- Allows users to manage delivery agent records

Screenshot :





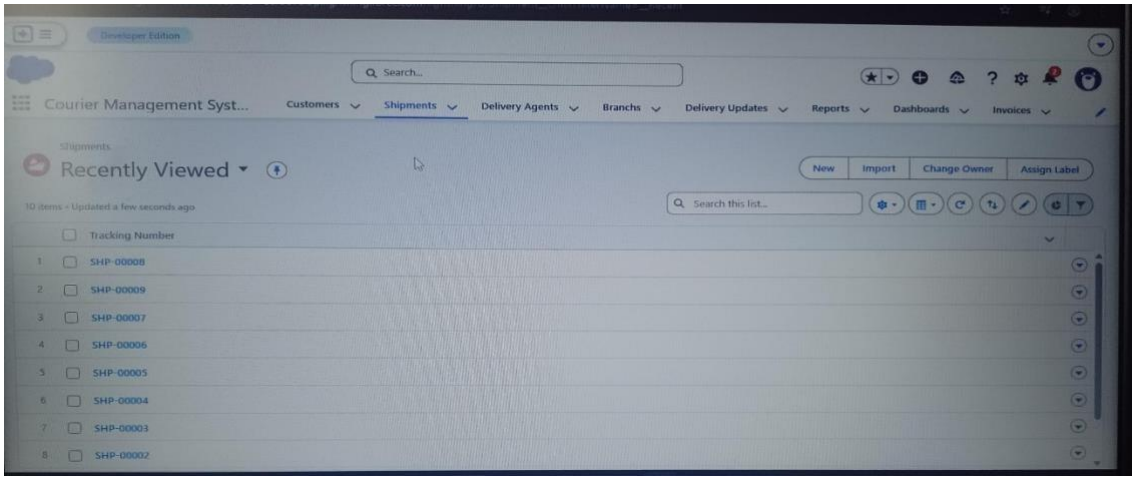
5.4 Shipment Management Module

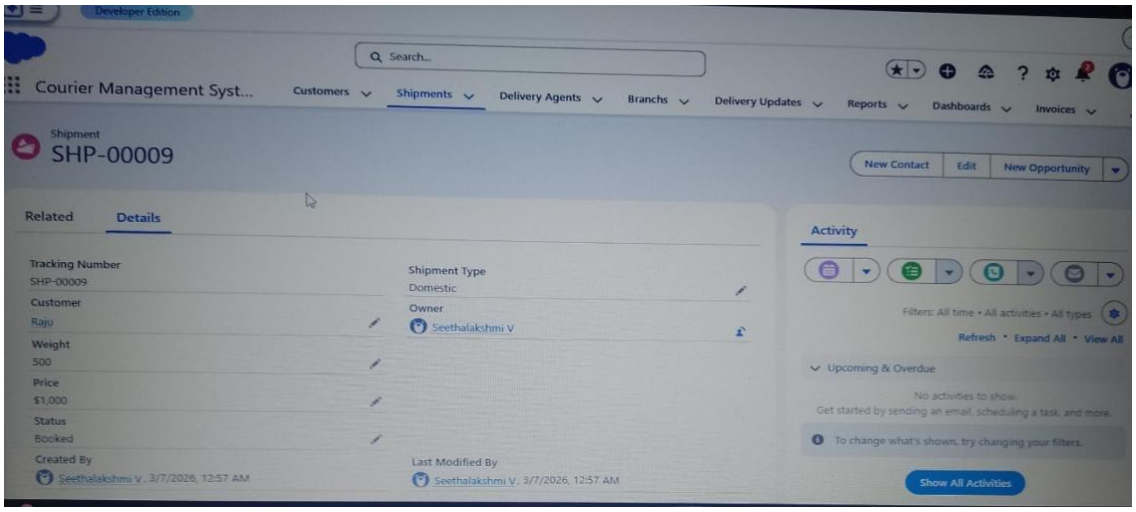
This module manages all shipment-related information.

Functions:

- Stores sender and receiver information
- Maintains shipment details and shipment date
- Tracks the delivery status of shipments
- Helps monitor shipment progress.

Screenshot :





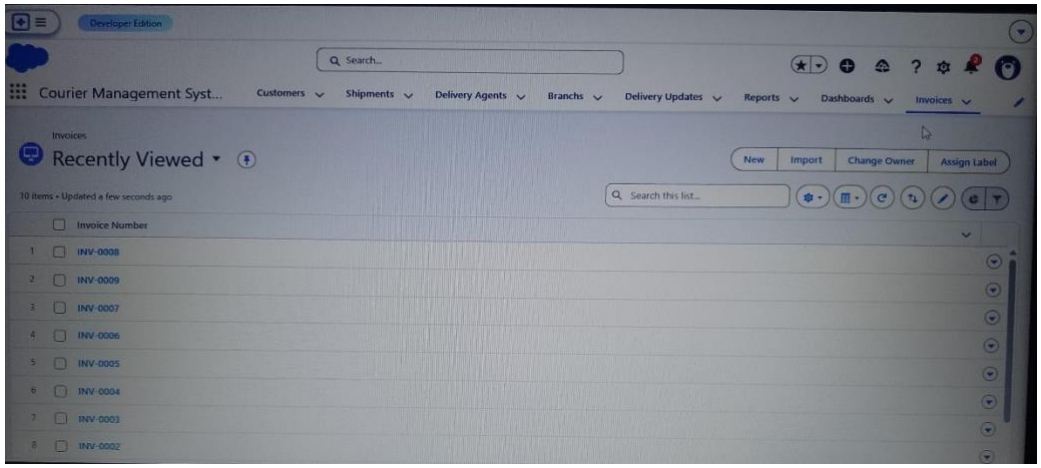
5.5 Invoice Management Module

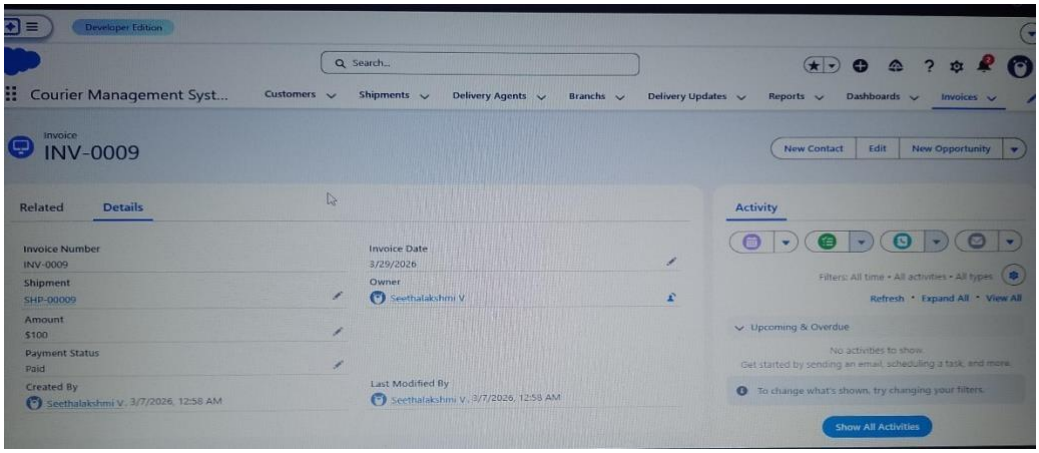
The Invoice Management Module manages billing details related to courier services.

Functions:

- Stores invoice details and payment information
- Maintains records of shipment billing
- Helps track payments for courier services
- Allows users to view invoice records.

Screenshot:





6. Reports

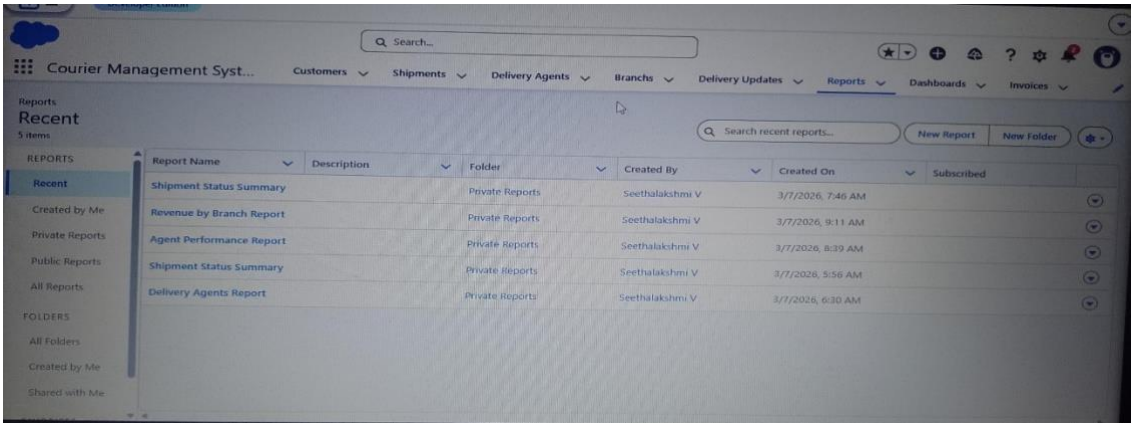
Reports are used to analyze and organize the data stored in the system. They help users view important information related to courier operations in a structured format.

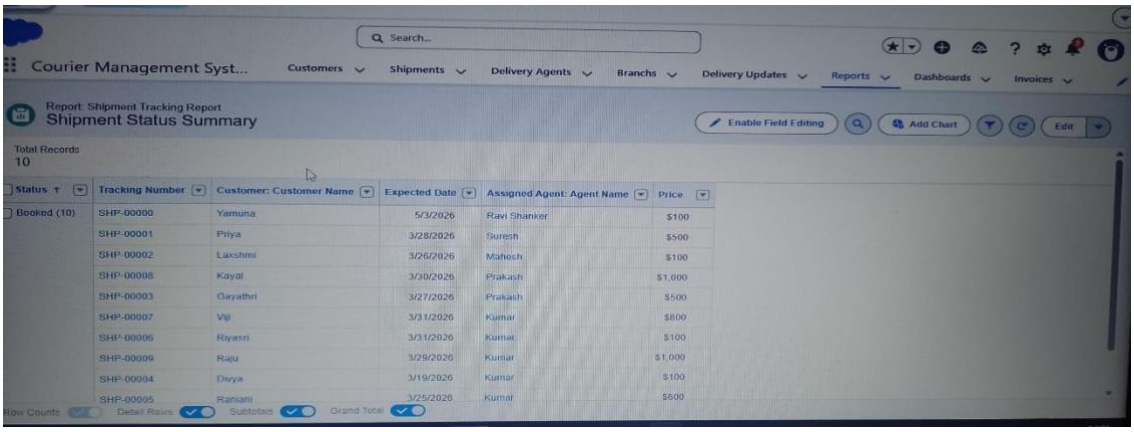
Functions of Reports:

- Displays shipment information in an organized format
- Shows delivery agent performance details
- Helps track the number of shipments handled by agents
- Allows users to filter and analyse courier data
- Provides useful insights for decision making

Types of Reports in the System:

- Agent Performance Report
- Shipment Tracking Report
- Revenue Report **Screenshot:**





7.Dashboard Module

The Dashboard Module provides a graphical representation of the data using charts and graphs.

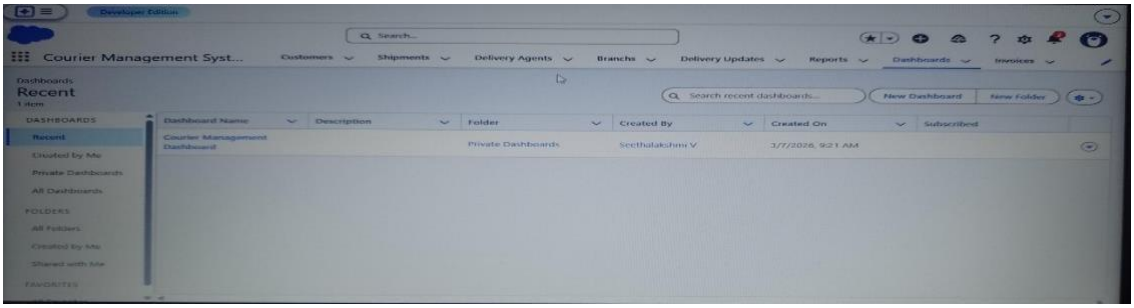
It helps users quickly understand the overall performance of the courier management system.

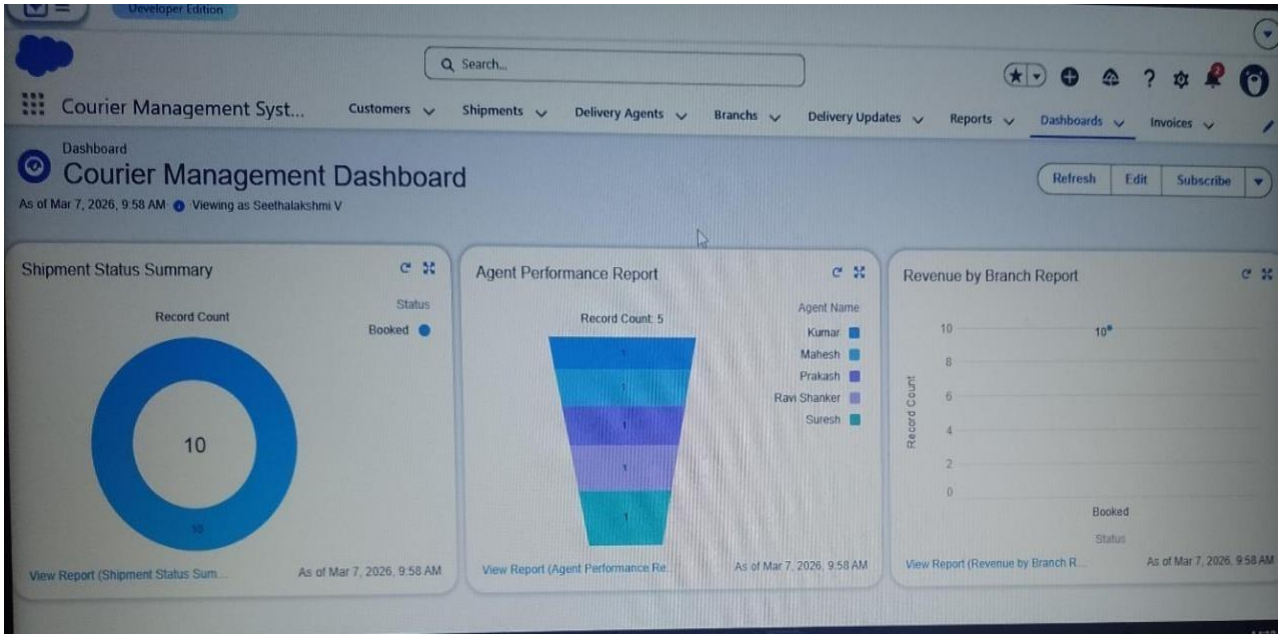
Functions:

- Displays courier system data using charts and graphs
- Shows shipment status information
- Displays agent performance data visually

- Helps monitor courier operations easily
- Provides quick insights into system performance.

Screenshot:





8. Advantage and Disadvantages

Advantages

- Courier details and shipment information can be managed easily.
- It helps to track shipment status quickly.
- Reduces manual work and saves time.
- Data can be stored and accessed securely.

Disadvantages

- Requires internet connection to access the system.
- Initial setup may take time.
- Users need basic knowledge to operate the system.

9. Conclusion

The Courier Management System developed using Salesforce helps improve the efficiency of courier operations.

It allows users to manage customers, shipments, delivery agents, and invoices in a centralized system while providing analytical insights through reports and dashboards.

10. Future Scope

- Mobile application can be developed for easy access.
- SMS or email notification can be added for shipment updates.
- GPS tracking can be integrated for real-time delivery tracking.
- More automation features can be added to improve efficiency.
